

GBI Issue Queue System:

implementing the challenge propagation mechanism

Viktoras Veitas

GBI Workshop April 26, 2016 VUB, Brussels

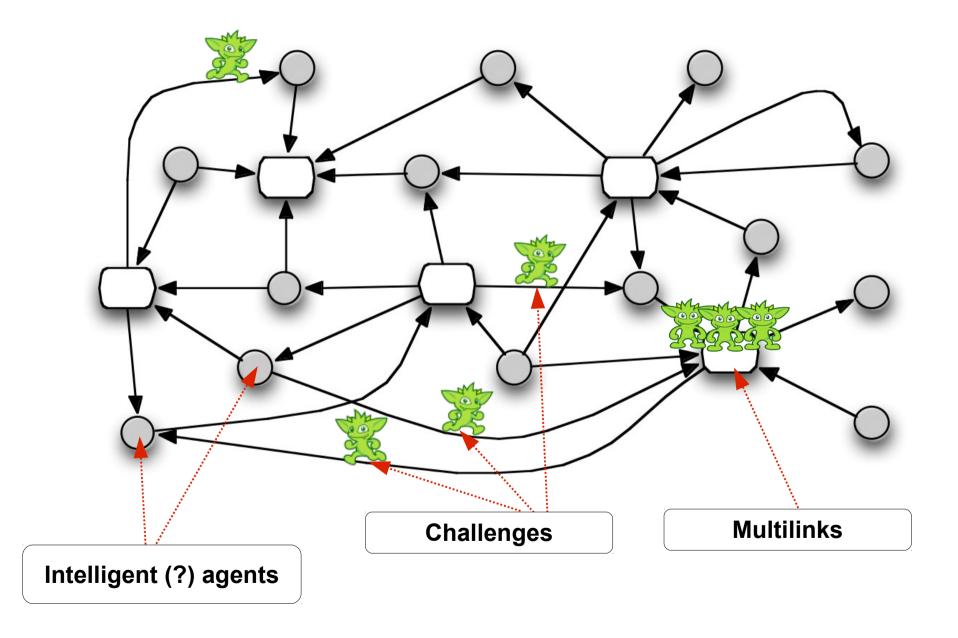

? Issue Queue System?

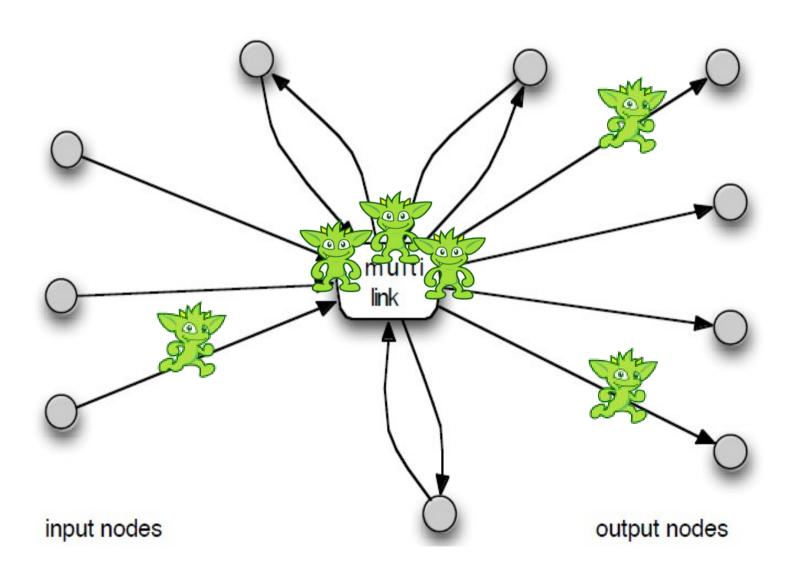

What do we need it for?

- Managing the work-flow;
- Keeping track of and organize creative ideas;
- Intelligent routing of messages / content / issues;
- Facilitating creativity (medium for idea sharing & feedback);
- Involving larger community (volunteers, collaborators, scientific board...);
- ... Information extraction from wider sources (Web?);

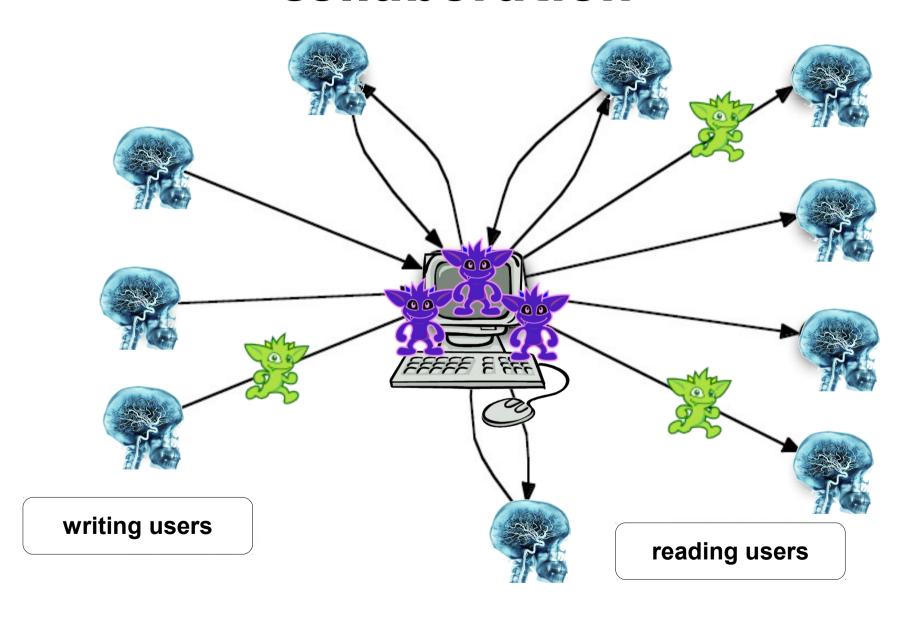

Network with multilinks

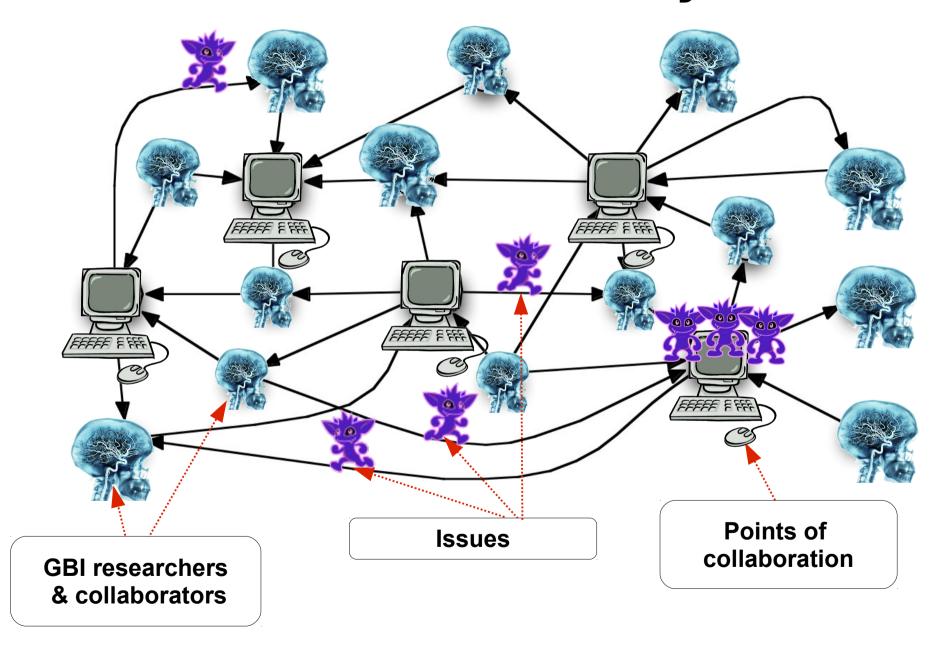

A multilink

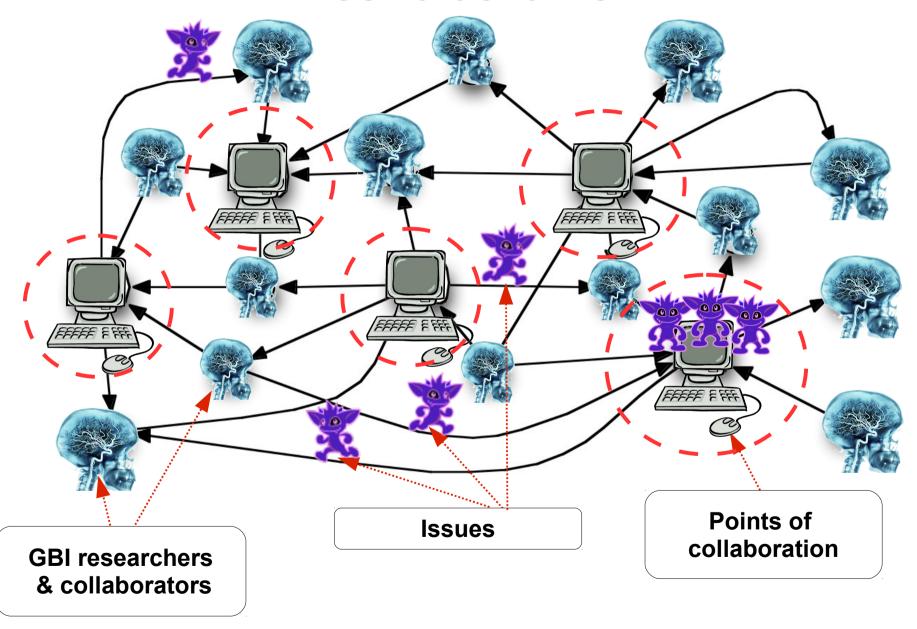

Multilink = "point of collaboration"

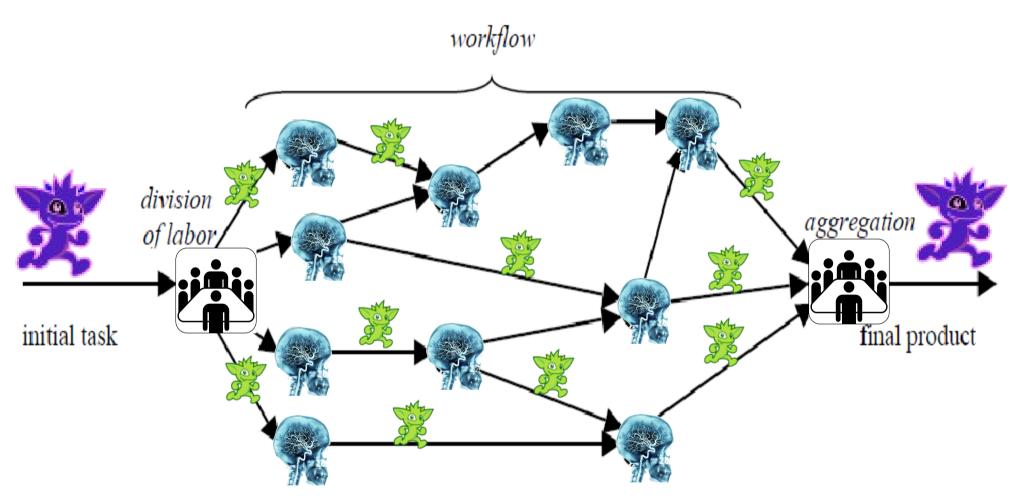

GBI Issue Queue System

Self - organizing points of collaboration

Managing workflow - getting things done

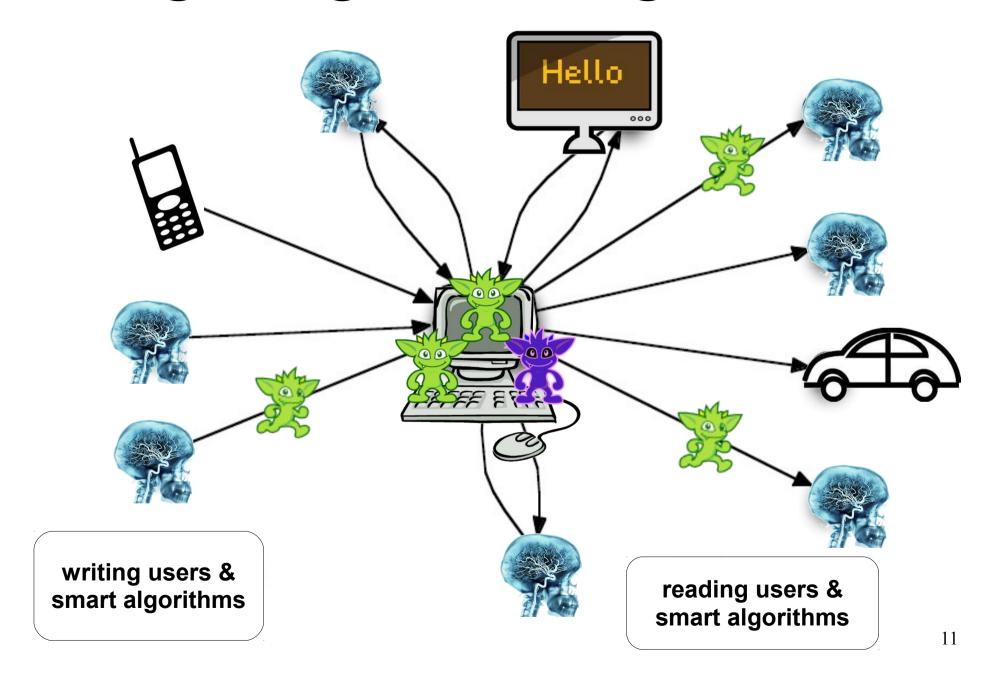

separate activities

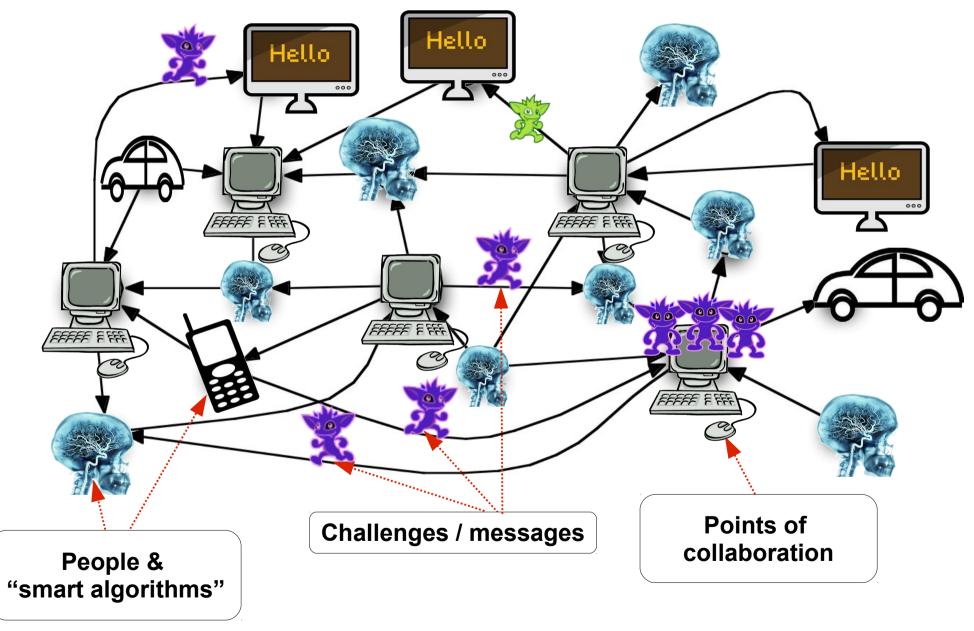

Features

- Information organization:
 - Automatic sorting of issues (according to collectivelly adjusted formula by urgency, status,
 - Tagging / taxonomies / "content themes";
 - Personal dashboards / customized views;
 - importance, etc);
 - Subscription + email notification system;
 - Direct propagation of issues;
- Getting Things Done;
 - Assignment of issues to users + duedates;
 - Sprints / GBI meetings;
- And some nice things, like Latex interpreter ...;

Integrating "smart algorithms"

towards the Global Brain...

Making them (or us?) UNDERSTAND...

- In order to communicate we will need to interpret same challenges in a similar way (= assign the same meaning to them);
- This implies:
 - a single [language? | protocol? | user interface?];
 - pretty smart processing of challenges by "smart algorithms";
 - teaching smart algorithms = conveying our understanding of the world.

```
<?php
  echo "Thank you";
  if (time spent<time limit &&
  bored(audience) == FALSE) {
    echo "Questions?";
    answer questions();
?>
```
